Host a Static Website Locally: Set Up a Local Server
Apache and Host a Simple HTML page with your
name

Name: Nantha Krishnan.G.K.

Department : AML

Introduction and Overview

In this POC, we will learn how to host a static website locally using the Apache HTTP Server. This process involves setting up a local web server, configuring it correctly, and hosting a simple HTML page. By following these steps, you'll get hands-on experience with configuring and running a local Apache server, which is a foundational skill for web hosting and server management.

Objective

The goal of this project is to:

1. Set up a local web server using Apache.
2. Configure the server to host static files.
3. Create and host a simple HTML page displaying your name.

Importance of Local Hosting

Local hosting is an essential skill for developers, as it allows them to test and experiment with web applications in a controlled environment. It offers several advantages, such as:

Hands-On Learning: Gain practical experience with server setup and configuration.

Testing Ground: Safely test and debug websites before deploying them to a live server.

Offline Development: Work on web projects without requiring an active internet connection.

Step-by-Step Overview

Step1:

Search for "Apache Lounge" on Google and click the first link to access the official website.

The screenshot shows a Microsoft Bing search results page for the query "apache lounge". The search bar at the top contains the text "apache lounge". Below the search bar, there are navigation links for "SEARCH", "COPILOT", "IMAGES", "VIDEOS", "MAPS", "NEWS", "SHOPPING", "MORE", and "TOOLS". The search results show "About 9,260,000 results". The first result is "Apache Lounge" with the URL "https://www.apachelounge.com". Below the title, there is a brief description: "Apache Lounge is a site for Apache Web Server users and developers, offering up-to-date Windows binaries and popular third-party modules. Join the user-to-user community forum to ...". To the right of the main result, there is a "Related searches" section with several suggestions: "apache lounge website", "apache lounge download", "apache lounge php", "apache 2.4.54 win64", "is apache lounge safe", "apache 2.4.55 win64", "apache httpd lounge", and "download apache 2.4.54 for windows". Below the main result, there are links for "Downloads", "Register", "Log In", "Other Software", "News & Hangout", "About", and "Search". The "Downloads" link is highlighted. Below the "Downloads" link, there is a link for "Apache" and a link for "About". The "About" link is highlighted. Below the "About" link, there is a link for "Search". The "Search" link is highlighted. Below the "Search" link, there is a link for "Other content from apachelounge.com". The "Other content from apachelounge.com" link is highlighted. Below the "Other content from apachelounge.com" link, there is a link for "Apache Win64 2.2 VC10 Binaries and Modules Download". The "Apache Win64 2.2 VC10 Binaries and Modules Download" link is highlighted. Below the "Apache Win64 2.2 VC10 Binaries and Modules Download" link, there is a link for "Coding & Scripting Corner - Apache Lounge". The "Coding & Scripting Corner - Apache Lounge" link is highlighted.

Step 2 :

Click on the "Downloads" option located on the left-hand side of the Apache Lounge website.

The screenshot shows the Apache Lounge website. The header features the Apache Lounge logo and the text "POWERED BY APACHE" and "Apache Software Foundation certification". Below the header, there is a navigation menu with links for "Home", "VS17", and "Additional". The "VS17" link is highlighted. The main content area is titled "Apache 2.4 VS17 Windows Binaries and Modules". It contains a paragraph describing the binaries and their compatibility. Below the paragraph, there is a section titled "Apache 2.4 binaries VS17" with a link for "Info & Changelog". The "Info & Changelog" link is highlighted. Below the "Info & Changelog" link, there is a table listing the binaries. The table has two columns: "Binary" and "Size". The first row is "Apache 2.4.62-240904 Win64" with a size of "11.432k". The second row is "Apache 2.4.62-240904 Win32" with a size of "10.285k". Below the table, there is a link for "PGP Signature" and a link for "PGP Signature (Public PGP key)". The "PGP Signature" link is highlighted. Below the "PGP Signature" link, there is a link for "PGP Signature (Public PGP key)". The "PGP Signature (Public PGP key)" link is highlighted. Below the "PGP Signature (Public PGP key)" link, there is a link for "PGP Signature (Public PGP key)". The "PGP Signature (Public PGP key)" link is highlighted.

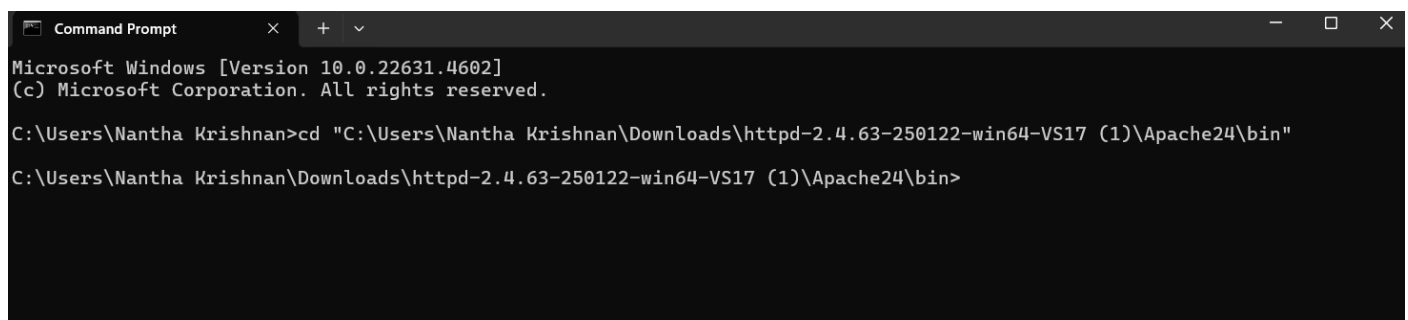

Step 3 :

Click on the link "**Apache 2.4.62-240904 Win64**" (Windows version), download the file, and extract all its contents.

Step 4 :

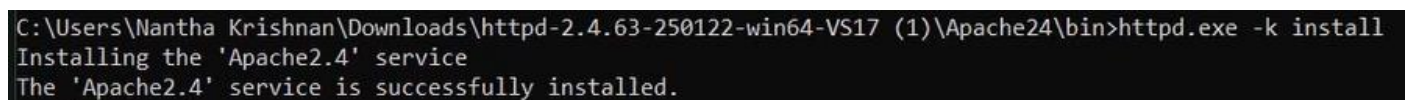

Open Command Prompt as Administrator (Windows + R, type cmd, right-click and select 'Run as Administrator') and use the command `cd C:\path\to\apache\bin` to set the path to the Apache bin folder.

Step 5 :

Then Run the installation command :

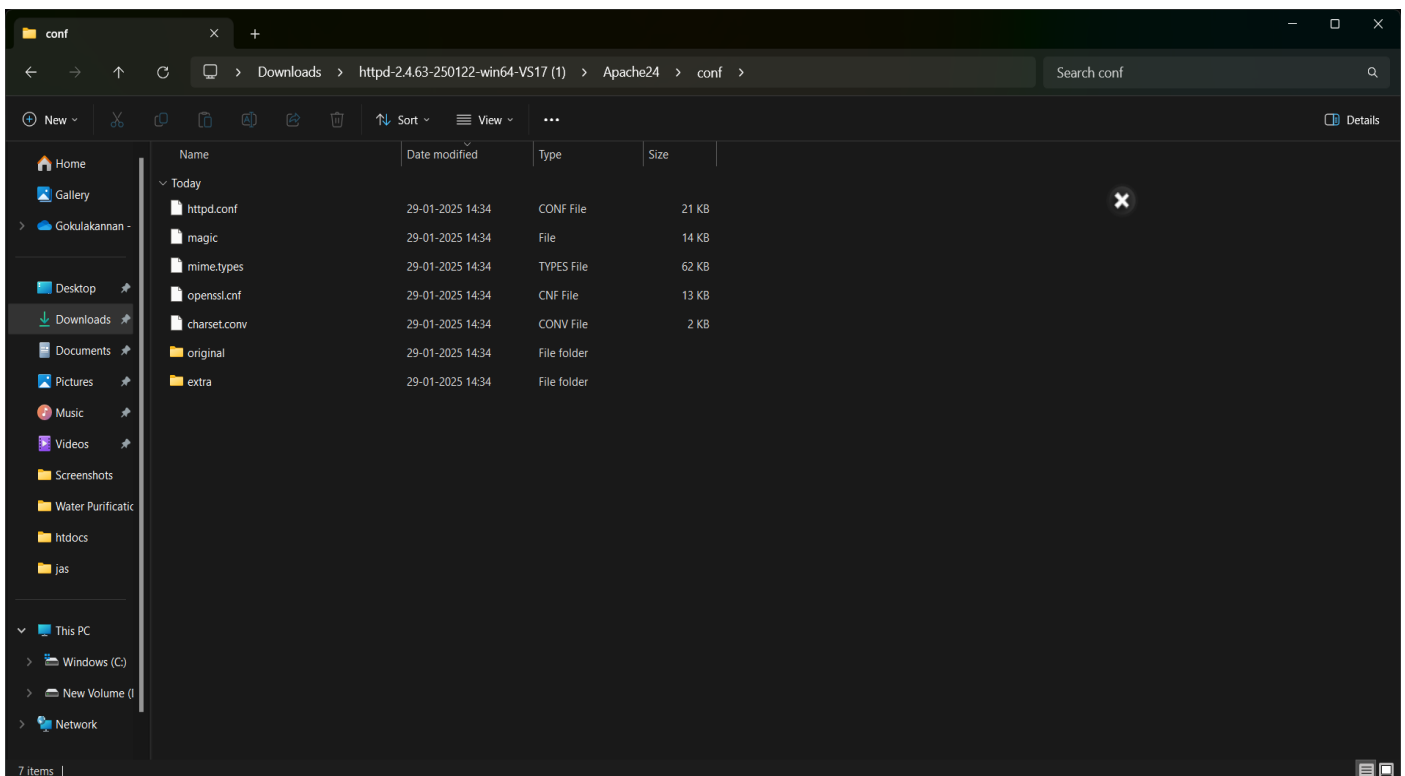

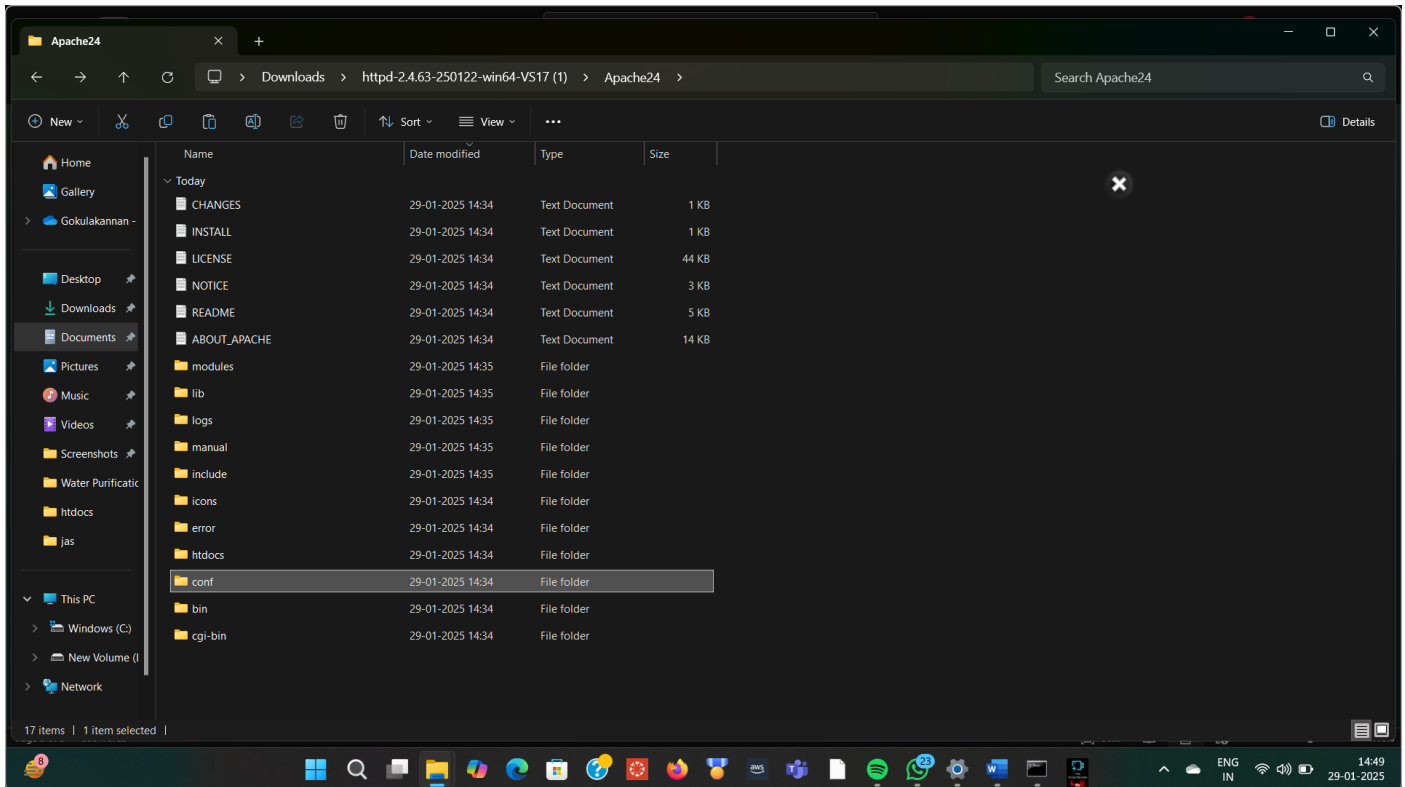

httpd.exe -k install

Step 6 :

Navigate to the Apache folder you downloaded, go to the **conf** folder, and right-click on the httpd.conf file; select 'Edit with Notepad'

(Apache/conf/httpd.conf)

Step 7 :

Inside the **httpd.conf** file, replace the content with the provided configuration. Ensure you update the **SRVROOT** directive with your Apache installation path. This configuration defines the server's root directory, listening port, modules, document root for serving web files, logging paths, and basic permissions, ensuring Apache serves content correctly from the specified htdocs directory.

```
# Define SRVROOT
Define SRVROOT "C:/Users/H1/Downloads/httpd-2.4.62-240904-win64-VS17/Apache24"

# Ensure the path resolves correctly for DocumentRoot
ServerRoot "${SRVROOT}"

# Listening Port
Listen 80

# ServerName (optional, but recommended for local testing)
ServerName localhost:80

# LoadModules (essential modules)
LoadModule access_compat_module modules/mod_access_compat.so
LoadModule actions_module modules/mod_actions.so
LoadModule alias_module modules/mod_alias.so
LoadModule allowmethods_module modules/mod_allowmethods.so
LoadModule auth_basic_module modules/mod_auth_basic.so
LoadModule authn_core_module modules/mod_authn_core.so
LoadModule authz_core_module modules/mod_authz_core.so
LoadModule dir_module modules/mod_dir.so
LoadModule log_config_module modules/mod_log_config.so
LoadModule mime_module modules/mod_mime.so
LoadModule rewrite_module modules/mod_rewrite.so
LoadModule setenvif_module modules/mod_setenvif.so

# DocumentRoot and Directory configuration
DocumentRoot "${SRVROOT}/htdocs"
<Directory "${SRVROOT}/htdocs">
    Options Indexes FollowSymLinks
    AllowOverride None
    Require all granted
</Directory>

# Logs (you can adjust the paths as needed)
ErrorLog "${SRVROOT}/logs/error.log"
CustomLog "${SRVROOT}/logs/access.log" common
```

```
# Additional settings for MIME types, DirectoryIndex, etc.
<IfModule mime_module>
    TypesConfig conf/mime.types
    AddType application/x-compress .Z
    AddType application/x-gzip .gz .tgz
</IfModule>

<IfModule dir_module>
    DirectoryIndex index.html
</IfModule>
```

Step 8 :

Open Command Prompt and type the command **httpd.exe -t** to test the configuration file. If the configuration is correct, you should see '**Syntax OK**'.

```
C:\Users\HP\Downloads\httpd-2.4.62-240904-win64-VS17\Apache24\bin>httpd.exe -t
Syntax OK
```

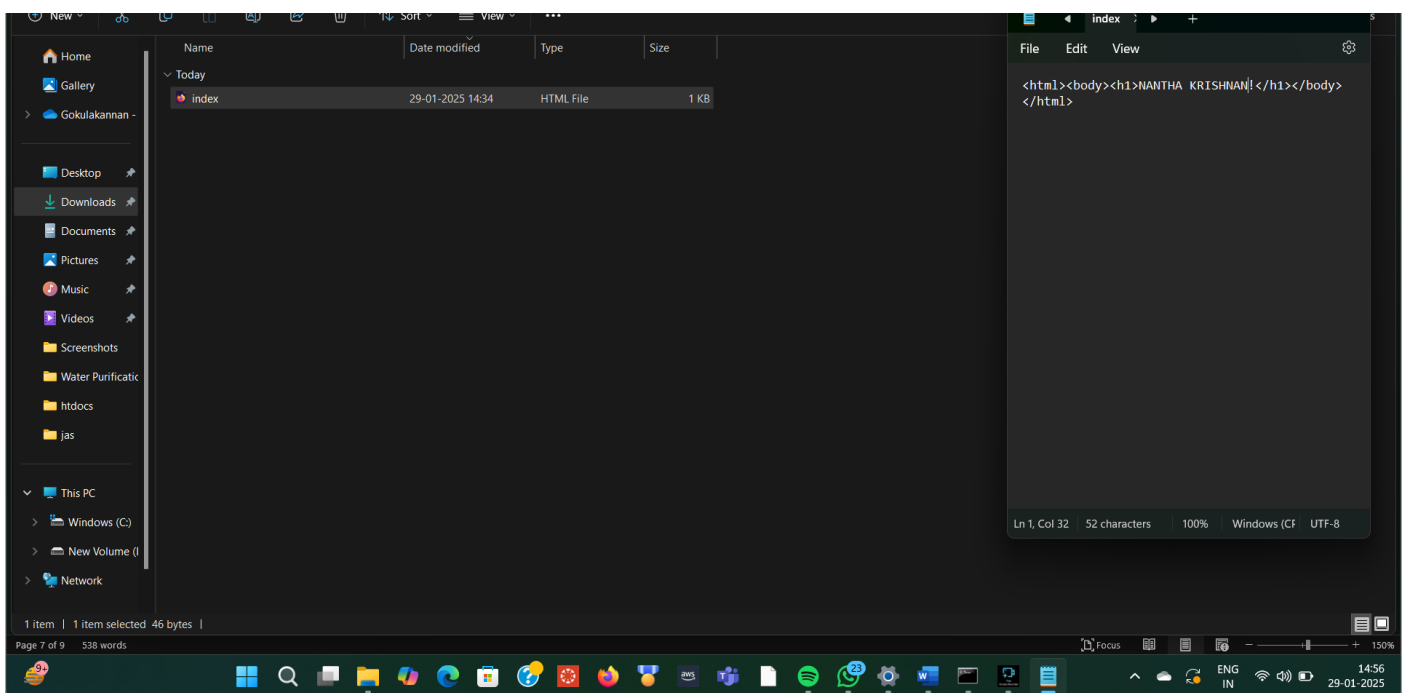

Step 9 :

Run the command **httpd.exe -k start** to start the Apache server.

```
C:\Users\HP\Downloads\httpd-2.4.62-240904-win64-VS17\Apache24\bin>httpd.exe -k start
```

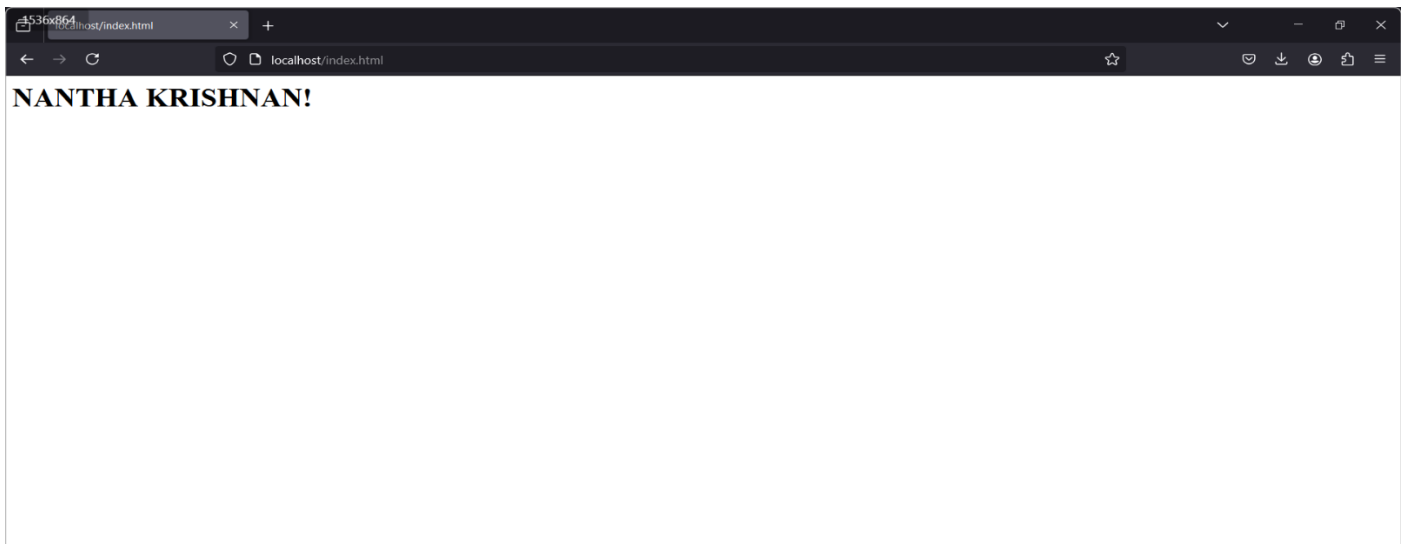

Step10:

Go to the Apache folder, navigate to the **htdocs** folder, and find the **index.html** file. Right-click on it and select 'Edit with Notepad'. Create a simple model to display your name in HTML (you may optionally add CSS for styling).

Step 12 :

Open the Chrome browser and type **localhost/index.html** in the address bar. You should be able to see the website hosted successfully.

Expected Outcome

By completing this POC, you will:

1. Successfully configure and run an Apache server locally.
2. Host a static HTML website that displays your name.
3. Understand the basics of web server configuration and file hosting.
