Set Up a Local Git Repository:

Initialize Git repository locally and version control your static website

Name: Nanthan Krishnan.G.K.

Department: AML

Introduction and Overview

Version control is a critical component in modern software development, allowing teams and individuals to track changes, collaborate efficiently, and maintain a history of their work. Git, a distributed version control system, is widely used for its flexibility, speed, and powerful features. This Proof of Concept (POC) document outlines the process of setting up a local Git repository and using it to version control a static website. This will enable efficient management of website updates and facilitate collaboration among developers.

Objectives

- Understand the basics of Git and version control.
- Learn how to initialize a Git repository locally.
- Apply version control to a static website.
- Perform basic Git operations such as adding, committing, and viewing changes.

Importance

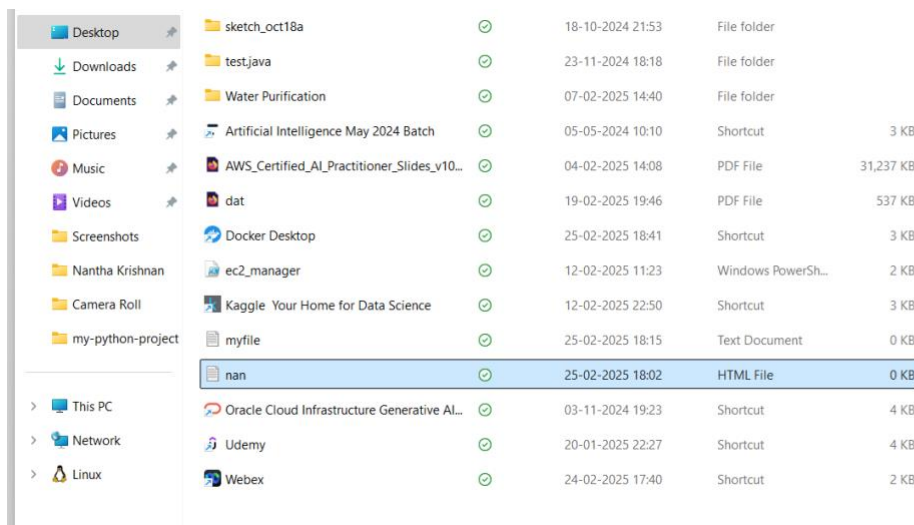

- **Enhanced Collaboration:** Enables multiple developers to work on the same project without overwriting each other's work.
- **Change Tracking:** Maintains a detailed history of code changes, making it easy to identify and revert to previous versions if needed.
- **Backup and Recovery:** Provides a secure backup of code that can be restored in case of data loss.
- **Efficient Project Management:** Helps manage different versions of the project efficiently, facilitating smooth feature development and bug fixing.

STEPS:

- **PRE-REQUISITE:** Ensure Git is installed on your local machine. You can verify this by running `git --version`.

STEP 1: Create a Directory with Website Files:

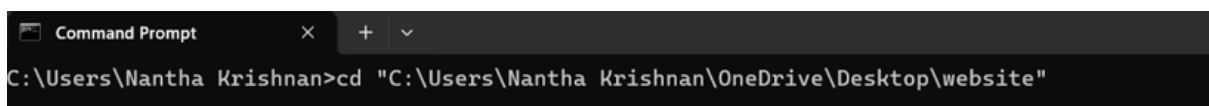

- Create a folder on your local machine containing all your static website files (HTML, CSS, JS, etc.).

STEP 2: Navigate to the Directory:

- Open the terminal or command prompt.
- Use the `cd` command to change the current directory to the folder containing your website files.

`cd path/to/your/website-folder`

STEP 3: Initialize a Local Git Repository:

- Run the following command to initialize an empty Git repository in your project folder:

`git init`

STEP 4: Add Files to the Repository:

- Add all files to the Git staging area using:
`git add .`

```
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git add .
```

STEP 5: Configure Git Settings:

- Set up your Git username and email (if not configured already):

```
git config --global user.name "Your Name"
```

```
git config --global user.email  
your.email@example.com
```

```
Command Prompt
C:\Users\Nantha Krishnan>cd "C:\Users\Nantha Krishnan\OneDrive\Desktop\website"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git init
Initialized empty Git repository in C:/Users/Nantha Krishnan/OneDrive/Desktop/website/.git/
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git add .
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git config --global user.name "Nantha Krishnan G K"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git config --global user.email "g.k.nanthakrishnan@gmail.com"
```

STEP 6: Commit the Files:

- Commit the added files with a meaningful commit message:

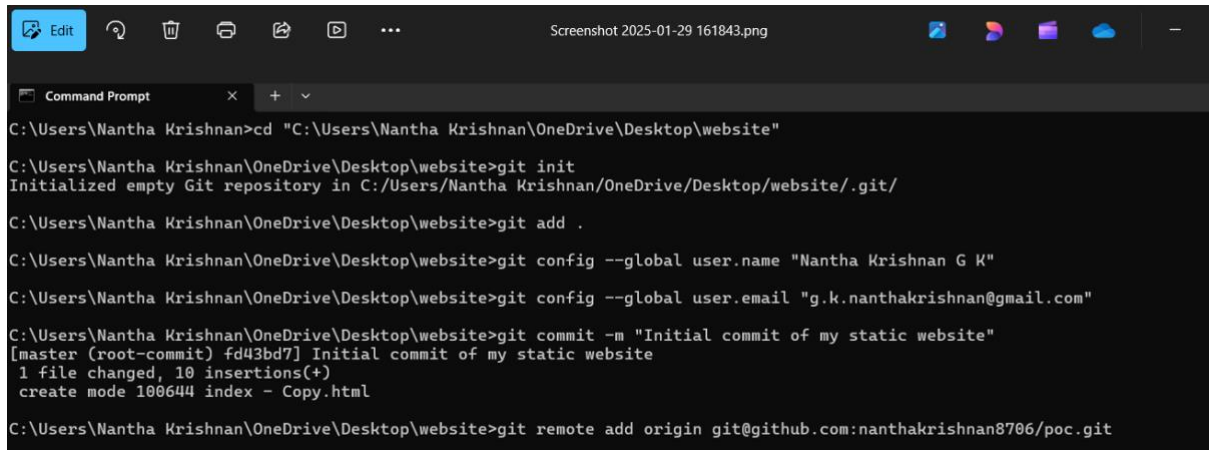

```
git commit -m "Initial commit with website files"
```

```
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git commit -m "Initial commit of my static website"
[master (root-commit) fd43bd7] Initial commit of my static website
1 file changed, 10 insertions(+)
create mode 100644 index - Copy.html
```

STEP 7: Add Remote Repository:

- Copy the Git remote command provided when you create a repository on GitHub and paste it into your terminal:

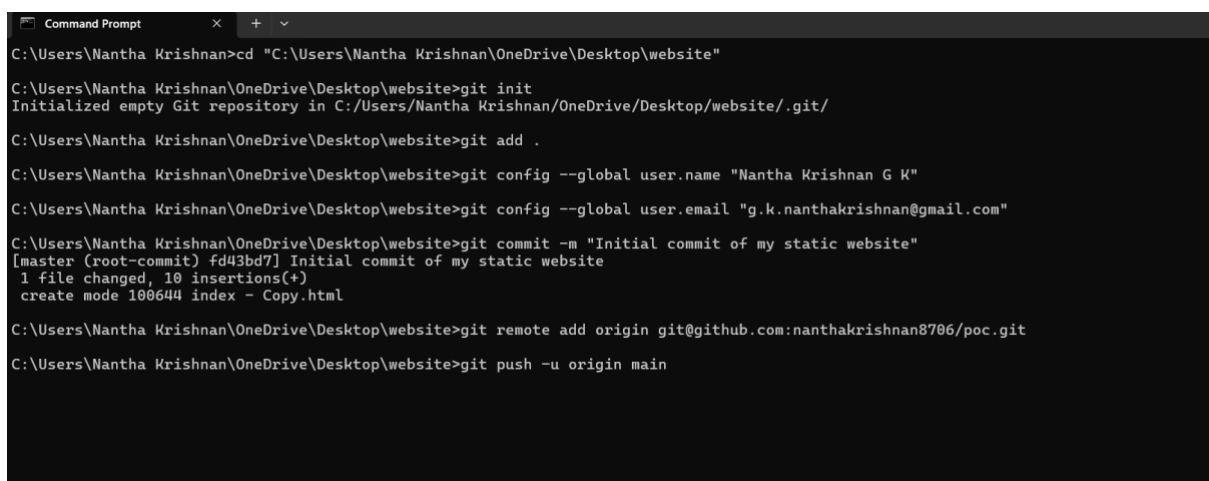

git remote add origin <https://github.com/yourusername/your-repo.git>

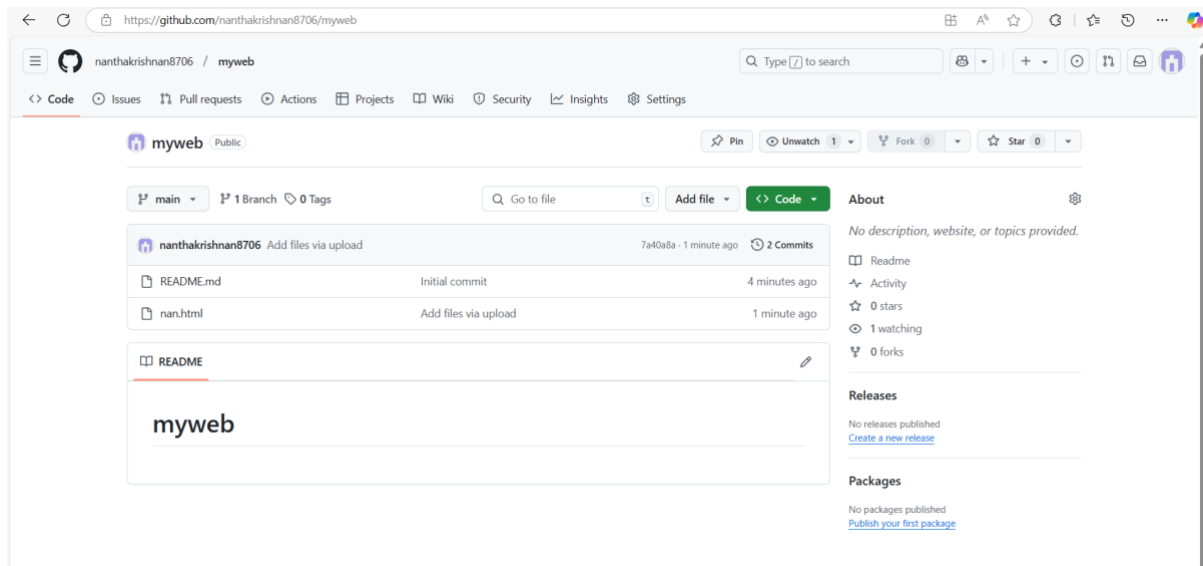

```
Command Prompt
C:\Users\Nantha Krishnan>cd "C:\Users\Nantha Krishnan\OneDrive\Desktop\website"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git init
Initialized empty Git repository in C:/Users/Nantha Krishnan/OneDrive/Desktop/website/.git/
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git add .
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git config --global user.name "Nantha Krishnan G K"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git config --global user.email "g.k.nanthakrishnan@gmail.com"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git commit -m "Initial commit of my static website"
[master (root-commit) fd43bd7] Initial commit of my static website
1 file changed, 10 insertions(+)
create mode 100644 index - Copy.html
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git remote add origin git@github.com:nanthakrishnan8706/poc.git
```

STEP 9: Push Files to GitHub Repository:

- Copy the git push command provided when you created the GitHub repository.
- Paste and execute the command in your terminal to push your committed files to the remote GitHub repository.
- Once the command executes successfully, your static website files will be uploaded to your GitHub repository.

```
Command Prompt
C:\Users\Nantha Krishnan>cd "C:\Users\Nantha Krishnan\OneDrive\Desktop\website"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git init
Initialized empty Git repository in C:/Users/Nantha Krishnan/OneDrive/Desktop/website/.git/
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git add .
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git config --global user.name "Nantha Krishnan G K"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git config --global user.email "g.k.nanthakrishnan@gmail.com"
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git commit -m "Initial commit of my static website"
[master (root-commit) fd43bd7] Initial commit of my static website
1 file changed, 10 insertions(+)
create mode 100644 index - Copy.html
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git remote add origin git@github.com:nanthakrishnan8706/poc.git
C:\Users\Nantha Krishnan\OneDrive\Desktop\website>git push -u origin main
```

Outcome

By completing this PoC of setting up a local Git repository, you will:

1. Successfully initialize a Git repository in your local static website folder.
2. Track changes made to your website files (HTML, CSS, etc.) using Git version control.
3. Understand the basic Git commands (git init, git add, git commit) for version control.
4. Commit your changes locally with a descriptive commit message.
5. Gain hands-on experience with Git and how it helps manage and track website file changes.
